About Us

Concord International Trading L.L.C is a company formed by a team of experienced professionals who possess hands on experience over a decade in the Oil & Gas and EPC sector. With over a decade of practical experience, we are committed to delivering innovative solutions and exceptional service to our clients worldwide. We are a rapidly expanding organization offering a wide range of support services in terms of providing technical & non-technical services in the areas of Construction, De-watering services, Industrial Contracting, Steel Fabrication, Turnkey projects operations and Shut down maintenance service support.

Concord International Trading follows innovative and strategic paths to meet the needs of various industries, focusing on local and multinational companies, we use both modern and conventional sourcing strategies to deliver the client requirements in a timely manner.

OUR SERVICES

Construction dewatering methods refer to techniques such as wellpoints, deepwells, bypass and flood control. In wellpoint and deepwells submersible pumps are installed in a drilled well shaft, while in bypass and flood control pumps are placed in the area that needs to be dewatered.

We have the capacity to handle a full range of dewatering projects, including mechanical and electrical installations, total refurbishments, site repairs and maintenance programs.

Through our vast in-depth experience in the field of pump rental solutions, we can always provide you with professional consultations on which pump will best suit your demands. We don't only offer pumps for rental purposes but we also repair them, if needed through our team of expert technicians.

Our well-equipped and trained team of mechanics can help us to promise you quality service and security.

DEEPWELL SYSTEMS

WELLPOINT SYSTEMS

SUMPS & DITCHES

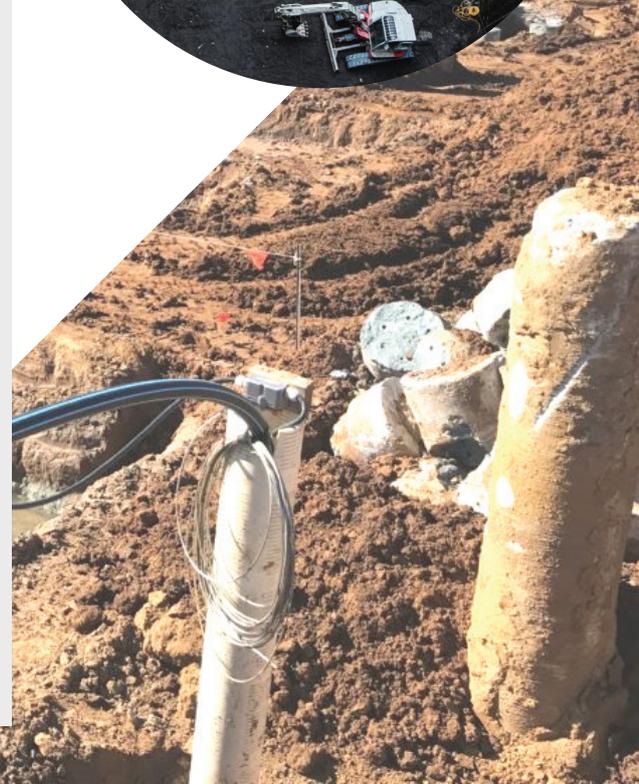

DEEP WELLS

We have the expertise and equipment to install deep wells as a dewatering solution in various subsurface conditions.

Our fleet of modern drill rigs and drilling tools are designed to penetrate coarse-grained sands, gravels, cobbles, boulders, and even rock. In addition, we are capable of drilling into artesian conditions where groundwater exists

under hydrostatic pressures. Deep wells are best suited for high-permeability soils and high pumping volumes or head conditions, making them the most efficient and cost-effective option for dewatering.

Electric submersible pumps with power ratings between 0.5 and 15 HP can be connected via flex hoses to a common HDPE header piping for deep well dewatering purposes. Installation of the well can be done outside or inside the excavation, depending on the shoring system. How the wells are spaced is determined by the subsurface conditions and the feasibility of construction, which the design team and field experts account for.

DEEP WELL DE WATERING SYSTEM

Deep well dewatering system is a method of dewatering used to perform deep excavation as a part of construction project. When the excavation performed is deep, that it exceeds the well point system (water table level) and water tremendously interfere the excavation process, we need to dewater and perform further excavation. Thus the process gives a dry site for excavation.

VACCUM WELLS

Vacuum wellpoints are an ideal choice for low to moderate permeability soils, which contain pockets and layers of permeable material interbedded with silts and clays. These wells are typically 15-25 feet deep, with a 3-foot long slotted well screen at the bottom and spaced from 2 to 10 feet apart, depending on the soil type.

An installed common HDPE header pipe applies a vacuum to the series of wellpoints, transporting water from the wellpoints through the riser and swing joint hose assemblies to the pump and eventually to the discharge location. Filter sands are used to fill the drilled holes outside the PVC wellpoints to decrease entrance loss and prevent clogging.

This sand also provides vertical drainage. Vacuum wellpoints have a tighter drawdown curve than deep wells and are a better option for dewatering when excavation ends in impermeable soils. Tieback installations can also be used in scenarios where vacuum lift limitations (15-20 feet) are exceeded, by hanging the common HDPE header pipe and vacuum pumps on the face of the shoring walls. Vacuum wellpoints can easily be integrated into all shoring systems, typically installed with the same equipment to help minimize costs.
